STATUS UPDATE · AS OF 2026-10-27

6-Month Project

AI-Agentic SOC capstone · Incident Response · Security Monitoring

github.com/Kai0sama28/DAE-6-Month-Project-Files

Recent progress

AI-Agentic SOC capstone

- LangGraph triage agent built and verified live
- MTTD ~13–15s, 85 tests passing
- FastAPI control plane + Streamlit dashboard
- Markdown/HTML report output

Incident Response

- Full live containment drill on Kali, Phases 1–4
- Firewall/quarantine, link isolation, VM suspend, SSH/account lockdown
- Evidence preserved; artifacts hashed and audited
- Transcripts and containment doc updated

Security Monitoring rubrics

- Monitoring Implementation
- Security Reporting
- Digital Evidence Management
- Post-Incident Procedures
- IR Documentation & Reporting

Latest commit 2026-10-27 · c050d16

AI-Powered Cyber Threats: The Rise of Generative Threat Groups

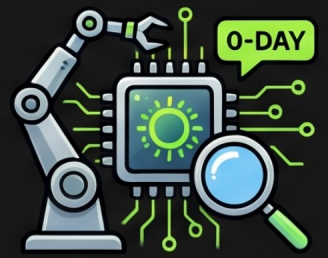

GTG-20006: Self-Healing Malware & Autonomous Espionage

Russian state-nexus actors automated phishing and used AI agents to continuously rebuild malware to evade security detections.

GTG-50014: Mass Secret Mining & SaaS Breaches

Financially motivated cybercriminals scanned 1.8M mobile apps for API keys to execute rapid, multi-tenant supply chain extortion.

GTG-10007: Automated Zero-Day Exploit Foundries

Chinese-speaking operators deployed autonomous AI swarms to reverse-engineer security appliances and discover zero-day vulnerabilities around the clock.

GTG-50029: Hacktivists Elevated to APT-Level Operations

Politically motivated actors used AI to author novel web exploits and build custom, multi-million record doxxing search engines.

Gemini Notebook

Teach back: the GTG exploits

Group	Actor	AI-powered exploit
GTG-20006	Russian state-nexus	Automated phishing; AI agents rebuild malware to evade detection
GTG-50014	Financially motivated cybercriminals	Scanned 1.8M mobile apps for API keys; multi-tenant supply chain extortion
GTG-10007	Chinese-speaking operators	Autonomous AI swarms reverse-engineer security appliances and find zero-days around the clock
GTG-50029	Politically motivated hacktivists	AI-authored web exploits; custom multi-million record doxxing search engines

Common thread: AI automates and scales what used to take skilled teams. Attackers are using it to hack, so defenders need to train AI to defend.

Gaps and moving forward

Current gaps

- No dedicated timeline / MITRE view
- Analyst decisions aren't written back to TheHive
- API has no authentication

Next steps

- Complete the containment playbook for incident response
- Study networking acronyms and fundamentals with NotebookLM
- Research ways to train AI for the project, because the rise of bad actors using ai is increasing. Therefore ai should be trained to combat that.
