Progress report

Status Update Sep 21–30, 2026

Wazuh agent enrollment, SOC lab stage 2, and the Python 1 tracker GUI

Week of Sep 21–27

Wazuh agent enrollment resolved

Problem

ossec.conf still held the placeholder address 0.0.0.0, so the agent exited with error 4112 (Invalid server address). The MSI reconfiguration path never worked.

Fix

Edited the address field directly, backed up the original as ossec.conf.bak, then started WazuhSvc.

Result

DESKTOP-VCKJCPV is enrolled as agent 007 and reporting to the manager at 10.11.3.185, closing a blocker open since Sep 19.

Commit efdca85 · Sep 23

Week of Sep 28–30

SOC lab stage 2 stack deployed

TheHive 5.2.16

Pinned on purpose, since 5.3+ requires a license. Cassandra and Elasticsearch 7.17.13, UI on localhost:9000. Fits the 7.7GiB Docker VM at about 6.1GiB used.

Suricata 8.0 + EveBox

53,039 ET Open rules loaded. Offline pcap replay through run_ids.sh, because Docker Desktop cannot capture live lab traffic. Console on localhost:5636.

Smoke test passed

A scapy-generated SSH brute-force pcap produced 7 alerts, including a genuine ET SCAN Potential SSH Scan (sid 2001219). EveBox confirmed 3 alert groups.

Commit ba5c157 · Sep 30

Python 1

Tracker Keeper GUI unblocked

Problem

macOS system Python links against an older Tcl/Tk that crashes on current macOS.

Fix

Documented the Homebrew python@3.11 plus tcl-tk path as the working setup.

Added

run_gui.sh, a launcher that prefers Homebrew Python and refuses to start a second instance if one is already running.

Next week

Wazuh rule 100010 never fires

Agent002 reports PAM session events, so auth.log is being parsed. That points to sshd being off or a wrong IP on the Kali box, not a parsing problem.

Plan: re-run the brute force from Kali and capture it with Wireshark through run_ids.sh, to get a genuine IDS artifact for the capstone.

Wazuh follow-ups

- Close the passwordless enrollment gap on the manager
- Assign agent 007 to a group
- Tune syscheck/fim
